The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence represents an HPV-Lyth, fusion protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         E6 protein; E7 protein; fusion protein; HPV16; HPV-associated cancer; cervical cancer; immune response; lower gastrointestinal tract cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       type E7 and E6 polypeptides from human papillomavirus type 16 (HPV16). The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CTLA4; E7; fusion protein; B7 receptor positive B cell; CTLA4 receptor positive T cell interaction; immune syst autoimmune disease; lupus erythematosus; host-graft;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 248 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAY43480;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a soluble CTLA4 fusion protein, for use in the method of the invention. The specification describes a method for regulating CTLA4 receptor positive T cell interactions with B7 receptor positive B cells. The method comprises contacting the CTLA4-positive T cells with monoclonal antibody fragments reactive with CTLA4. This inhibits (and therefore regulates) interactions between CTLA4 positive T cells and B7 positive B cells. The method may be used for regulating CTLA4 receptor positive T cell interactions with B7 receptor positive B cells. In this way the immune system of an individual can be manipulated (especially suppressed) for the treatment of autoimmune diseases (especially lupus erythematosus) and to prevent host-graft and transplant rejection. (Updated on 27-AUG-2003 to correct OS field.) (Updated on 17-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC protein which is reactive with the B7 antigen. DNA encoding the CTLA4 CC protein can be used in a vector in a host vector system for producing soluble CTLA4. The CTLA4 fusion protein can be used for regulating T cell cinteractions with B7 positive cells. The CTLA4Ig fusion protein can be used for treating immune system diseases mediated by T cell interactions with B7 positive cells. The immune system diseases include graft versus constitute cells. The immune system diseases include graft versus that disease, psoriasis, immune discrets associated with graft cransplant rejection, T cell lymphoma, benign lymphocytic angilits, and autoimmune disease such as lupus erythematosus, Grave's disease, Caddison's disease, Crohn's disease, multiple sclerosis, ulcerative colitis, Sjogren's syndrome, and mixed connective tissue disease. The Cusion protein may also be used to block the proliferation of viruses tission of relativation, such as the virus that causes AIDS, Chilvi. The present sequence was created in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     27-JUN-1991;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         र्
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The specification describes a CTLA4 receptor/immunoglobulin (Ig) fusion components of the protein which is reactive with the B7 antigen. DNA encoding the CTLA4 protein can be used in a vector in a host vector system for producing soluble CTLA4. The CTLA4 fusion protein can be used for regulating T cell interactions with B7 positive cells. The CTLA4Ig fusion protein protein can be used for treating immune system diseases mediated by T cell interactions with B7 positive cells. The immune system diseases include graft versus host disease, psoriasis, immune disorders associated with graft transplant rejection, T cell lymphoma, benign lymphocytic anglitis, and autoimmune diseases such as lupus erythematosus, Grave's disease, Cohn's disease, multiple sclerosis, ulcerative colitis, Sjogren's syndrome, and mixed connective tissue disease. The fusion protein may also be used to block the proliferation of viruses dependent on T cell activation, such as the virus that causes AIDS, THIVI. The present sequence was created in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                       ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention provides new monoclonal antibodies (MAbs) which bind the certracellular domain of CTLA4 and prevent the binding of CTLA4 to B7 CC antigen. The MAbs can be used for regulating T cell interactions with B7 CC positive cells. They can also be used for preventing or reversing CC diseases and neoplasia. They can be used for treating diseases e.g. graft versus host disease (GCHD), psoriasis, immune disorders associated with CC lymphoblastic leukemia, testicular angiocentric R cell lymphoma, benign CC lymphocytic angitts, autoimmune diseases such as lugus erythematosus, CC lymphocytic angitts, primary myxedema, Graves disease, pernicious CC anemia, autoimmune atrophic gastritis, Addison's disease, pernicious continue atrophic gastritis, Addison's disease, insulin CC dependent diabetes mellitis, Goodpasture's syndrome, myasthenia gravis, CC pemphigus, Crohn's disease, sympathetic ophthalmia, autoimmune uveitis, CC ulcerative colitis, Sjogren's syndrome, rheumatoid arthritis, CC ulcerative colitis, Sjogren's syndrome, rheumatoid arthritis, CC ulcerative colitis, Sjogren's syndrome, rheumatoid arthritis, They can CC diseases. The present sequence represents the CTLA4/E7 fusion protein CC domain an amino terminal CTLA4 domain and a E7 carboxy-terminal CC domain
                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                            This represents a CTLA4/E7 fusion protein. The invention provides a CTLA4-II fusion protein that binds the B7 antigen and has a first amino acid sequence consisting of the extracellular domain of CTLA4 and a second amino acid sequence consisting of the hinge, CH2 and CH3 regions of a human immunoglobulin molecule. The fusion protein inhibits interaction of T cells with B7-positive cells and may be useful for treating immune system diseases, e.g. autoimmune diseases, cancer or viral infections. The present sequence is an example of such a fusion protein and contains an amino-terminal CTLA4 domain and aN E7 carboxy- terminal domain

CTLA4 is a receptor protein having a high degree of homology with CD28. The CTLA4 receptor is identified as a ligand for the B7 antigen. The CTLA4 protein can also be used to construct a fusion protein of CTLA4 and human can also be used to passed. The CTLA4 protein was fused to the hinge CH2 immunoglobulin (IG)-gammal. The CTLA4 protein was fused to the hinge CH2 and CH3 regions of human IgC-gammal. Soluble CTLA4-Ig fusion proteins can be used to regulate T-cell interactions with B7-positive cells and to

                                                                                                                                                                                                                                                                                                                                                                      Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC A dengue virus recombinant replicon has a deletion of the complete coding CC sequence for preM protein of dengue virus and also includes elements of CC e.g. the non-coding region in the whole of the 5'-end, the coding region of the front 20 amino acids in the C protein, and the coding region of CC NS1 protein signal; coding regions of all non-structural proteins. The C obtained vaccines are useful in producing preventives or/and remedies for CC cancer like cervical cancer and viral diseases. Such vaccines can CC virus can infect dendritic cells, and can effectively present antigen to CC repeatedly produce efficient timmune response thereby strengthening the CC repeatedly produce efficient immune response thereby strengthening the CC provide immunity effect. Different types of dengue virus can be used to CC repeatedly produce efficient immune response thereby strengthening the CC control of the companies were prepared by using a gene-CC expressing system using of the full-length dengue virus cDNA clone (CRS/FLD2). The recombinant virus vectors were transfected into baby conclusing sequence corresponds to the HPV type 16 E7 protein whose CC encoding gene is used as the gene of interest in the recombinant replicon

The DEN replicon contains exogenous nucleotide sequences such as human papillomavirus (HPV) antigen proteins, immune regulators or combination of HPV antigen and immune regulators. The invention is useful for producing a drug for the prophylaxis and treatment of cancer or viral infection. The present sequence is a human papillomavirus oncoprotein.

The variant is preferably a deletion mutant comprising at least half, and preferably two thirds of full length E6 or E7 protein starting from the N- or C- terminal, or is a full length E6 molety fused to a full length E7 molety. The variant optionally has a linkage molety and a foreign protein or peptide which facilitates the purification of, and enhances the immunogenicity of, the fusion protein. This sequence is a full length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mouse; granulocyte-macrophage-colony stimulating factor; GM-CSF; chimeric; heat shock protein; HSP; Flt-3 ligand; FL; exotoxin A; ET antigenic; immunogenic; cytotoxic T cell response; tumour; vaccine;
New chimeric polypeptide, useful as anti-tumor vaccines, comprises carboxy terminal fragment of heat shock protein, Flt-3 ligand or
                                                                                                                                                                                                                                                                20-OCT-1999; 99US-00421608.

The fusion protein is used in the method of the invention. The station describes a method of determining whether a compound stimulates a Th1-like response. Th1 calls are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial

The E7 protein was used to construct a fusion protein with Mycobacterium bovis heat shock proteins (Hsp). The fusion proteins are used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprises contacting naive lymphocytes in the detecting the TH1-like response exhibited by the cell sample. The protein detecting the TH2-like response exhibited by the cell sample. The protein which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         fusion partner; chimeric.

                                                                                                                                                                                                                                       encoding
encoding
The invention relates to a novel nucleic acid composition useful as an immunogen. The composition comprises a combination of: a first nucleic acid vector comprising a first sequence encoding an antigenic polypeptid or peptide, and optionally, a second sequence linked to the first sequence and encoding an immunogenicity-potentiating polypeptide (IPP); and a second nucleic acid vector encoding an anti-apoptotic polypeptide. When the second vector is administered with the first vector to a subject, a T cell mediated immune response to the antigenic polypeptide or peptide is induced that is greater in magnitude and/or duration than an immune response induced by administration of the first vector alone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protein, and encoding a highly immunogenic polypeptide fusion partner capable of enhancing immunogenicity of the E6 or E7 protein in the mammallan host. The invention is used as a vaccine for the prevention or treatment of an HPV infection or a neoplasm associated with HPV infection. This sequence represents the HbsAg-BE7T fusion protein sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                          24-FEB-2003; 2003US-0449429P.

The nucleic acid composition is useful as an immunogen for inhibiting the growth of a tumor, hence it has cytostatic activity. This sequence represents ananti-apoptotic vector E7-
                                                                                                                                                                                                                                                       24-FEB-2003;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           6
```

The invention relates to a novel nucleic acid composition useful as an immunogen. The composition comprises a combination of: a first nucleic acid vector comprising a first sequence encoding an antigenic polypeptide or peptide, and optionally, a second sequence linked to the first sequence and encoding an immunogenicity-potentiating polypeptide (IPP);

CC The invention further includes: a particle comprising a material that is CC suitable for introduction into a cell or an animal by particle CC bombardment, bound to which is the first and second vectors or CC composition; a pharmaceutical composition capable of inducing or CC enhancing an antigen specific immune response, comprising the particle CC and a carrier or an excipient; inducing or enhancing an antigen specific cimmune response in a subject; increasing the numbers of CD8+ CTLs of Specific for a selected desired antigen in a subject; and inhibiting the growth of a tumor in a subject. The nucleic acid composition is useful as CC an immunogen for inhibiting the growth of a tumor, hence it has CC cytostatic activity. This sequence represents ananti-apoptotic vector E7-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                    This sequence represents a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Haemophilus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immunotherapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce simmune response in a patient to an HPV antigen. They can also be used preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                    Bruck C, Cabezon S

                                                                                                                                                                                           The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence represents an HPV-H. influenzae D protein, fusion protein of the

                                                                                                                                                                                                                                                                                                                                                                         AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an 86 or 87 protein or 86/87 fusion protein from HPV (represented in AAY25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an immune response in a patient to an HPV antigen. They can also be used for preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Streptococcus pneunoniae CLYTA protein of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (cLyth) or thioredoxin. The present sequence represents an HPV-Lyth, fusion protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC The present sequence is that of a triple fusion protein comprising, from CC the N-terminal end, Escharichia coli thioredoxin, human ubiquitin and CC than papillomavirus proteinni/3 E7, followed by a histidine affinity CC tail. The triple fusion protein was produced in E. coli GI724 host cells CC transformed by an expression vector comprising DNA (see ABA9128) CC encoding the fusion. This is an example of the production of triple CC fusion proteins of the invention that comprise ubiquitin fused between CC thioredoxin and a protein of interest, in this case ProteinDi/3 E7. A CC claimed method of producing a recombinant protein of interest involves: CC column and a host cell (preferably E. coli) under conditions which allow CC co-expression of the triple fusion and a ubiquitin-specific endoprotease CC (especially uBpl from Saccharomyces cerevisiae); and recovering the CC recombinant protein directly from the bacterial cells after it has been CC subjected to the action of the ubiquitin-specific endoprotease in vivo. CI In the present case, expression is controlled by the addition of tryptophan. The recombinant protein can used as a vaccine for cancer CC therapy. (Updated on 29-AUG-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a fusion protein comprising a Mycobacterium tuberculosis heat shock protein (Hsp) 40 fused at its 3' end to a HPV16 E7 protein. The fusion protein is used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Thi cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial

The fusion protein can be expressed in collbacillus, microzymes and plants. The fusion protein is used to make immunostimulant injections, as it can produce specific cell immune and humoral immune responses. It possesses prophylaxis and therapeutic capacity for preventing human papillomavirus (HPV) infection, but also can be used for immunotherapy of pointed condyloma, tumours and cancer caused by HPV. (Updated on 06-AUG-2003 to correct OS field.) (Updated on 12-SEP-2003 to standardise OS field)

The fusion protein is used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein compriseing at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial
The present sequence represents a fusion protein comprising a Streptococcus pneumoniae heat shock protein (Hsp) 65 fused to a HPV16 E7 protein. The fusion protein is used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ T

                            The present sequence represents a fusion protein comprising a Aspergillus fundigatus heat shock protein (Hsp) 60 fused to a HPV16 E7 protein. The fusion protein is used in the method of fused in the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response whibited by the cell sample. The proteins which may be used in the method of the invention are Hsp55, Hsp40, Hsp50, and Hsp71. The method may be used to identify compounds that stimulate Th1-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S
                                                                              The present sequence is the protein sequence of human papillomavirus E7 comcoprotein. E7 promotes oncogenesis through an inhibition of p21Cip21 cc transport into the nucleus. E7 abrogates Raf-associated arrest and CC prevents inhibition of cyclin E-CDK2 activity without disrupting Raf cc induction of p21Cip21. E7 neither interacts with p21Cip1 nor derepresses conduction of p21Cip21. E7 neither interacts with p21Cip1 nor derepresses conduction of p21Cip1 and cyclin E-CDK2 complexes. Raf down-regulates steady-cc state levels of Akt, a regulator of p21Cip1 localisation, leading to loss cof p21Cip1 phosphorylation and accumulation of p21Cip1. E7 disrupts the cffects of Raf on Akt activity and prevents p21Cip1 nuclear accumulation. CC Maintenance of Akt activity is necessary and sufficient to bypass Raf carrest. The invention provides methods for identifying and using compounds capable of promoting the nuclear localization of p21Cip1. The methods can be used to inhibit aberrant cellular proliferation for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                              CC The present sequence represents a fusion protein, comprising E6 and E7 CC polypeptides from human papillomavirus type 16 (HFP16). The fusion CC protein is designated E6E7PentM, and comprises an E6 amino terminus CC (where residues 63 and 106 have been replaced with glycine) and an E7 CC carboxy terminus (where residues 24, 26 and 91 have been replaced with CC glycine). E6E7PentM is representative of fusion proteins of the CC invention. The specification describes human papillomavirus E6 and E7 CC polypeptides, where the E7 polypeptide has mutations at any one or more CC of the amino acids corresponding to amino acids 24, 26 or 91 of the CC sequence given in ADO44073 and the E6 polypeptide has no mutations or has CC mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of CC the invention are useful for treating or preventing human papillomavirus CC immune responses against HPV. They are also useful for treating lower content of the sequence of the securion for treating lower contents and they cancer of the sequence of the securion for treating lower contents and they cancer of the sequence of the securion proteins are useful for generating contents and they cancer of the sequence of the securion for treating lower contents and they cancer of the sequence of the sequence of the securior of the sequence of the se
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   뭐
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     á
                                                          The present sequence represents a fusion protein, comprising E6 and E7 CC polypeptides from human papillomavirus type 16 (HPV16). The fusion CC protein is designated E6E7TetM, and comprises an E6 amino terminus (where residues 63 and 106 have been replaced with glycine) and an E7 carboxy CC terminus (where residues 24 and 26 have been replaced with glycine). CC E6E7TetM is representative of fusion proteins of the invention. The CC specification describes human papillomavirus E6 and E7 polypeptides, CC where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids cancers, such as cervical cancer. The fusion proteins and nucleic acids cancers, such as cervical cancer. The fusion proteins and nucleic acids cancers, such as cervical cancer. The fusion proteins and nucleic acids cancers they they are also useful for treating lower gastrointestinal CC against they. They are also useful for treating lower gastrointestinal cancer, and other cancers of the reproductive system, including penile and vulvar cancers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             B
                                                                                                                                                                                                                                                             The present sequence represents an B6E7 fusion protein, comprising wild crype B6 and E7 polypeptides from human papillomavirus type 16 (HPV16). The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids 24, 26 or 91 of the sequence given in AD044073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids 20, 26 or 91 of the sequence given in AD044072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes the construction of a novel polypeptide with immunogenic and altered biological function of a protein, where the polypeptide has regions of the protein of about 10.40 amino acids in a different order. The polypeptide, or its DNA, is useful for active immunization without cross-reactivity and problems associated with the biological function of the protein. This sequence represents the human papillomavirus type 16 E7 protein which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 98 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           30-APR-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         E7 protein;

                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC The present invention relates to an expression vector comprising a CC promoter, signal sequences, an antigen, a cell-binding element, and a CC polyadenylation sequence. The expression vector can be used directly or CC after transduction of antigen-presenting cells, in vaccines for treatment CC and prevention of cancer, infections and autoimmune diseases. Vectors CC similar to the expression vector of the present invention, but expressing CC that contain MHC-II restricted epitopes for activation of CD4+ cells or CC elicitation of an immune response in vivo. The identified polypeptides CC (in APC) or vector containing DNA that expresses the polypeptides are Useful for treating the above conditions. The present sequence is HPV CC which hamper the secretion of the protein, which has a string of charged residues CC to result in the present protein, stablises the protein and facilitates CC secretion. The coding sequence for the present protein was used to CC construct the expression vector of the present invention. (Updated on 06-

The novel method comprises incubating an E6 or E7 peptide of HPV with a sample from the patient, and assaying the sample for a cell-mediated immune response against the peptide. The method is useful for determining the possibility and preventing the recurrence of a (pre-)cancerous growth in a patient infected with HPV or suspected of being infected with HPV. The HPV E6 or E7 peptides are useful in immunotherapy for the preventing or reducing the risk of development of (pre-)cancerous growths. This sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a new DNA sequence encodes an E6 or E7 fusion protein of HPV, where at least 20% of the original codons are replaced by codons which lead to enhanced translation in a mammalian cell, containing a mutation which results in production of a truncated non-functional protein, and encoding a highly immunogenic polypeptide fusion partner capable of enhancing immunogenicity of the E6 or E7 protein in the mammalian host. The invention is used as a vaccine for the prevention or treatment of an HPV infection or a neoplasm associated with HPV infection. This sequence represents the human papillomavirus-16 (HPV16) EB7T-protein sequence of the invention
                                                                                                                                                                     Key

The prod. of the second reading frame is the HPV-16 E7 protein whereas the third reading frame encodes HPV-16 E6. The E6 and E7 ORPs are fused together to form a single continuous ORP via site directed mutagenesis and the immortilising potential of E7 is removed by altering two key codons of the HPV E7 sequence. The single ORF of HPV-16 E6/E7 may be inserted into vaccinia virus DNA at neutral sites (pref. by inserting two sets of the DNA in opposite orientations to overcome the problem of intertypic recombination) to make a recombinant virus vector for use immunotherapeutically to activate cells of the immune system against HPV. See also AAR27723-43. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Recombinant virus vectors encoding human papillomavirus proteins - for treating and vaccinating against HPV infections and conditions caused them, such as cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            L1 protein; capsomer; virus; vaccine; infection; treatment;

The vaccines can prevent or treat human papilloma virus infection. Such therapeutic vaccinations can be used for relief against, e.g. cervical carcinoma. Construction of chimeric proteins comprising amino acid residues from L1 protein, and e.g. E6 or E7 protein, which give rise to chimeric capsomers, combines prophylactic and therapeutic functions of a vaccine. Capsomers can promote elimination of persistently infected cells. Capsomers can also escape neutralization by pre-existing anti-capsid antibodles and hence possess longer circulating half-life as compared to chimeric virus-like particles. The fusion protein, which forms the capsomer, provides increased antigenicity. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                             12-OCT-2000;

The invention is useful for reducing the proliferation of cancer cells e.g. melanoma, adenoma, lymphoma, myeloma, carcinoma, glioma, plasmocytoma, sarcoma, thyoma, leukaemia, skin cancer, retinal cancer, breast cancer, prostate cancer, colon cancer, sophageal cancer, stomach cancer, pancreas cancer, brain tumours, lung cancer, ovarian cancer, cervical cancer, hepatic cancer, gastrointestinal cancer, and head and neck cancer cells. The invention is also useful for identifying a therapeutic target which involves assaying potential reagent for activity. The present sequence is human papillomavirus (HPV) type 16 E7 protein.
                      The present sequence represents the HPV16 E7 protein. HPV16 E7 was fused to a heat shock protein (Hsp), and used used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Thi cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprises contacting naive lymphocytes in the detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp40, Hsp40, and Hsp71. The method may be used to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                    Screening for compounds that stimulate lymphocyte cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human papillomavirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 98 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SXS
                          The invention relates to a novel composition comprising human papillomavirus (HPV) antigens or portions linked via hydrophobic bonds or mixed with very small size proteoliposomes (VSSP's). The invention further comprises a method for treating a tumor expressing an HPV antigen by administering an effective amount of this composition. The novel composition has cytostatic activity. The composition is useful for composition has cytostatic activity. The composition is useful for boosting the immune response against HPV antigens. The compositions are sultable for use in the pharmaceutical industry as vaccines in human therapeutics for cancer treatment. The cellular immune response against CHPV antigens is significantly boosted, especially with respect to cell cytotoxicity, ensuring that cells which exhibit the HPV antigen are CC destroyed more effectively. This sequence represents a Neisseria CC meningitidis Pl.7.16 delta 5 and HPV-16 E7 fusion protein, used in the CC expression of HPV antigens of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                The present sequence represents a fusion protein comprising Mycobacterium bovis heat shock protein (Hsp) 65 fused at its C terminal to a HPV16 E7 protein. The fusion protein is used in the method of the invention. The stimulates a Th1-like response. Th1 cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial
                                                                                                                                                                                                                                                                                      Screening for compounds that stimulate Th1-like responses in CD4+lymphocyte cells.
                                                                                                                                                                                                                                                                                                                                   WPI; 2001-138361/14.

                                                                                                                                                                                                                                                    The present sequence represents a fusion protein comprising Mycobacterium tuberculosis heat shock protein (Hsp) 71 fused to a HPV16 E7 protein. The fusion protein is used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naïve lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1 like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65. Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic.

The fusion protein is used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th1-like response. Th1 cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial

                                                                                                                                                                                                                                                                                                                       문
                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                 ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a new nucleic acid molecule (I) encoding a first fusion polypeptide useful as a vaccine composition. (I) comprises a first nucleic acid sequence encoding a first polypeptide or peptide that promotes processing via the Major Histocompatibility Complex (MHC) class I pathway (MHC-I-PP) and/or promotes development or activity of an antigen presenting cell (APC). The second nucleic acid sequence is linked in frame to the first nucleic acid sequence or to a linker nucleic acid sequence and encodes an antigenic polypeptide or peptide. The methods and compositions of the present invention are useful as therapeutic vaccine for cancer and for major viral infections, such as hepatoma and cervical cancer, that cause morbidity and mortality. They can also be used in treating animal diseases, such as equine herpesvirus, bovine viruses, warek's diseases, retroviral and lentiviral diseases and rabies, in the veterinary medicine context. The present sequence represents the human papillomavirus (HPV) E7 antigenic protein
                                                                                                                                                                                                                                                                                                                                                                                        Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a nucleic acid molecule that encodes a fusion CC polypeptide, comprising a first nucleic acid sequence encoding a comprise at least one immunogenicity-potentiating CC polypeptide, optionally, fused in frame with the nucleic acid, a linker comprise and that encodes an antigenic peptide or polypeptide. The nucleic acid encoding a linker peptide, and a nucleic acid that is linked comprise and that encodes an antigenic peptide or polypeptide. The nucleic acid molecule, polypeptides and vectors are useful as concines for enhancing immune responses, primarily cytotoxic Tector are completed (CTL) responses to specific antigens such as tumour or viral antigens, and for inhibiting growth or preventing re-growth of a tumour. The packaging cell line is useful for generating alphavirus replicon comparticles without contamination from replicon-competent virus. The pathogenic organisms include viruses such as human papilloma virus (HPV), hepatitis B virus, hepatitis C virus, human immunodeficiency virus, hepatitis B virus, and herpes simplex virus, intracellular parasites such as malaria, and bacteria that grow intracellular parasites such as malaria, and bacteria that grow intracellular parasites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a nucleic acid (I) encoding a chimeric CC fusion or fusion polypeptide, and a second domain comprising an antigen CC translocation polypeptide, and a second domain comprising an antigen CC having at least one antigenic peptide. Also described: (I) an expression CC vector comprising (I) operatively linked to a promoter and optionally, to CC one or more regulatory elements that enhance expression of the nucleic CC acid in a cell; (2) a particle comprising (I) or the expression vector; (CC acid in a cell; (2) a particle comprising (I) or the expression vector; (3) a cell that has been modified to comprising an antigen CC vector; (4) a chimeric polypeptide comprising an antigen an antigen polypeptide, and a second domain comprising an antigen CC comprising at least one antigenic peptide; (5) a pharmaceutical composition capable of inducing or enhancing an antigen specific immune response, CC comprising (I), expression vector, particle, cell, cell of the particle, CC or the chimeric polypeptide; and a carrier or excipient; (6) inducing or enhancing an antigen specific immune response by administering the CC composition described above; (7) increasing the number of CDS + CTLs Specific for a selected desired antigen in a subject by administering the CC composition described above; and (8) inhibiting the growth of a tumour in a subject by administering the composition described above. (I) has CC composition described above; and can be used in immunotherapy, and gene therapy. The present sequence represents HPV-16 E7, which is used in the composition described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to nucleic acid encoding a chimeric polypeptide comprising a translocation domain of a bacterial toxin and at least one antigenic peptide. The preferred translocation domain is domain II of Beudomonas aeruginosa exotoxin A (ETA(dII)) and the preferred antigen is antigen. The antigenic peptide comprises an epitope that binds to and is presented on the cell surface by major histocompatibility complex (MHC) class I proteins. The nucleic acid of the invention is useful as vaccine composition for enhancing antigen specific immune response, increasing the number of CDB+ cycotoxic T lymphocytes (CTLs) and for inhibiting the growth of a tumour. The present sequence is HPV-16 E7 protein.
